| | oxidoreductase domain-containing protein 2, MGC11335. |
| | Background: GFOD2 is a 385 amino acid secreted protein of the extracellular matrix that |
| | belongs to the gfo/idh/mocA family. Existing as two alternatively spliced isoforms, GFOD2 |
| | enhances matrix assembly and is encoded by a gene that maps to human chromosome |
| | 16q22.1. Chromosome 16 encodes over 900 genes and comprises nearly 3 $\%$ of the human |
| | genome. The GAN gene is located on chromosome 16 and, with mutation, may lead to giant |
| | axonal neuropathy, a nervous system disorder characterized by increasing malfunction with |
| | growth. The rare disorder Rubinstein-Taybi syndrome is also associated with chromosome 16, |
| | as is Crohn's disease, which is a gastrointestinal inflammatory condition. |
