	Background: The homeobox DNA-binding domain is a 60 amino acid motif that is conserved
	among many species and functions to bind DNA via a helix-turn-helix structure, thereby playing
	a role in transcriptional regulation and the control of gene expression. TSHZ3 (teashirt zinc
	finger homeobox 3), also known as KIAA1474, TSH3 or ZNF537, is a 1,081 amino acid protein
	that contains one homeobox DNA-binding domain and five C2H2-type zinc fingers. Localized to
	the nucleus, TSHZ3 functions as a transcriptional regulator that is involved in developmental
	processes throughout the body. The gene encoding TSHZ3 maps to human chromosome 19,
	which consists of over 63 million bases, houses approximately 1,400 genes and is recognized
	for having the greatest gene density of the human chromosomes.
