| | Background: The homeobox DNA-binding domain is a 60 amino acid motif that is conserved |
|---------------------|--|
| | among many species and functions to bind DNA via a helix-turn-helix structure, thereby playing |
| | a role in transcriptional regulation and the control of gene expression. TSHZ3 (teashirt zinc |
| | finger homeobox 3), also known as KIAA1474, TSH3 or ZNF537, is a 1,081 amino acid protein |
| | that contains one homeobox DNA-binding domain and five C2H2-type zinc fingers. Localized to |
| | the nucleus, TSHZ3 functions as a transcriptional regulator that is involved in developmental |
| | processes throughout the body. The gene encoding TSHZ3 maps to human chromosome 19, |
| | which consists of over 63 million bases, houses approximately 1,400 genes and is recognized |
| | for having the greatest gene density of the human chromosomes. |
