ZNF828, is a 812 amino acid protein that contains one C2H2-type zinc finger and is localized to
the cytoplasm and the nucleus. The gene encoding ZNF828 maps to chromosome 13.
Comprising nearly 4 $\%$ of the human genome, chromosome 13 contains around 114 million
base pairs and encodes over 400 genes. Chromosome 13 houses key tumor suppressor genes,
including BRCA2 and RB1, which are associated with breast cancer susceptibility and
retinoblastoma, respectively. Trisomy 13, also known as Patau syndrome, is deadly and the few
who survive past one year suffer from permanent neurologic defects, difficulty eating and
vulnerability to serious respiratory infections.
