	Background: Transcriptional repressor. Binds specifically to the DNA sequence 5'-GACTNGACT-
	3'. Has tumor suppressor activity. May play a role in control of cell proliferation and/or neural
	cell development. Regulates proliferation of early T progenitor cells by maintaining expression
	of HES1. Also plays a role in antero-posterior specification of the axial skeleton and negative
	regulation of the self-renewal activity of hematopoietic stem cells. Component of a Polycomb
	group (PcG) multiprotein PRC1-like complex, a complex class required to maintain the
	transcriptionally repressive state of many genes, including Hox genes, throughout development.
	PcG PRC1 complex acts via chromatin remodeling and modification of histones, it mediates
	monoubiquitination of histone H2A 'Lys-119', rendering chromatin heritably changed in its
	expressibility. Is not functionally redundant with BMI1, unlike BMI1 does not stimulate the E3
	ubiquitin-protein ligase activity in a reconstituted PRC1-like complex (By similarity).
