	designated ZW10) proteins. This complex is important for chromosome segregation because it
	recruits cytoplasmic Dynein to the kinetochore and plays a crucial role in the spindle
	checkpoint. The role of Zwilch in complex is thought to be evolutionarily conserved because the
	human homologs of Zwilch, ZWINT and ROD coimmunoprecipitate in a human cell line called
	HeLa. The human Zwilch, ZWINT and ROD complex localizes to the kinetochores at
	prometaphase. Mutations were discovered in Zwilch, ZWINT and ROD during a screen for
	mutations in alleles encoding putative chromosome instability genes in cases of human
	colorectal cancer. These mutations may contribute in part to the chromosomal instability
	phenotype of colorectal tumor cells.
