| Embryonic large molecule derived from yolk sac, MST108, MSTP108, Protein ELYS, Protein |
|---|
| MEL-28, Putative AT-hook-containing transcription factor 1, TMBS62. |
| Background: ELYS is a protein of the nuclear matrix that contains one AT hook DNA-binding |
| domain. ELYS is a dual nucleoporin/kinetochore protein required for nuclear pore assembly and |
| proper cell division. Nuclear pores span the nuclear envelope and act as gated aqueous |
| channels to regulate the transport of macromolecules between the nucleus and cytoplasm, |
| from individual proteins and RNAs to entire viral genomes. The A.T. hook near the C-terminus of |
| likely indicates ELYS can function as a transcription factor which may play a specific role in |
| hematopoietic tissues. It also may play a role in early embryo development, as ELYS is critical |
| for the survival of inner cells of the blastocyst. |
