Target Details

	Background: Essential bifunctional enzyme that catalyzes both the N-deacetylation and the N-	
	sulfation of glucosamine (GlcNAc) of the glycosaminoglycan in heparan sulfate. Modifies the	
	GlcNAc-GlcA dissacharide repeating sugar backbone to make N-sulfated heparosan, a	
	prerequisite substrate for later modifications in heparin biosynthesis. Plays a role in	
	determining the extent and pattern of sulfation of heparan sulfate. Compared to other NDST	
	enzymes, its presence is absolutely required. Participates in biosynthesis of heparan sulfate	
	that can ultimately serve as L-selectin ligands, thereby playing a role in inflammatory response.	
Gene ID:	3340
