Target Details

Alternative Name:	TMEM74 (TMEM74 Products)
Background:	Synonyms: TMEM 74, TMEM-74, NET36, HGNC, transmembrane protein 74, transmembrane protein-74, TMM74_HUMAN.
	Background: TMEM74 is a 305 amino acid protein encoded by a gene mapping to human
	chromosome 8. Made up of nearly 146 million bases, chromosome 8 encodes about 800

genes. Translocation of portions of chromosome 8 with amplifications of the c-Myc gene are found in some leukemias and lymphomas, and typically associated with a poor prognosis. Portions of chromosome 8 have been linked to schizophrenia and bipolar disorder. Trisomy 8, also known as Warkany syndrome 2, most often results in early miscarriage but is occasionally seen in a mosaic form in surviving patients who suffer to a varying degree from a number of symptoms including retarded mental and motor development, and certain facial and developmental defects. WRN is a DNA helicase encoded by chromosome 8 and shown defective in those with the early aging disorder Werner syndrome. Chromosome 8 is also associated with Pfeiffer syndrome, congenital hypothyroidism and Waardenburg syndrome.
