	nearly 900 genes. Notably, the Huntingtin gene, which is found to encode an expanded
	glutamine tract in cases of Huntington's disease, is on chromosome 4. FGFR-3 is also encoded
	on chromosome 4 and has been associated with thanatophoric dwarfism, achondroplasia,
	Muenke syndrome and bladder cancer. Chromosome 4 is also tied to Ellis-van Creveld
	syndrome, methylmalonic acidemia and polycystic kidney disease. Chromosome 4 reportedly
	contains the largest gene deserts (regions of the genome with no protein encoding genes) and
	has one of the two lowest recombination frequencies of the human chromosomes. The
	C4orf14 gene product has been provisionally designated C4orf14 pending further
	characterization.
