| | Background: LMBR1 is a 490 amino acid multi-pass membrane protein that is widely expressed |
|---------------------|--|
| | with strongest expression in heart and pancreas. Belonging to the LIMR family, LMBR1 shares |
| | 95 % sequence identity with the mouse protein and may play crucial role in the evolution of limb |
| | and skeletal system. LMBR1 is critical for expression of sonic hedgehog (Shh) in the developing |
| | posterior limb bud mesenchyme. Mutations in the gene encoding LMBR1 is the cause of |
| | several rare conditions such as acheiropody (ACHP) and syndactyly type 4 (SDYT4). ACHP is an |
| | autosomal recessive inherited disorder characterized by bilateral congenital amputations of the |
| | hands and feet. LMBR1L (limb region 1 protein homolog-like), also known as LIMR (Lipocalin-1- |
| | interacting membrane receptor), is a 489 amino acid multi-pass membrane protein that is |
| | thought to act as a receptor for Lipocalin-1 and may also assist in its endocytosis. |
