	clusters tandemly linked on chromosome five that demonstrate an unusual genomic
	organization similar to that of B-cell and T-cell receptor gene clusters. The alpha gene cluster is
	composed of 15 cadherin superfamily genes related to the mouse CNR genes and consists of
	13 highly similar and 2 more distantly related coding sequences. The tandem array of 15 N-
	terminal exons, or variable exons, are followed by downstream C-terminal exons, or constant
	exons, which are shared by all genes in the cluster. The large, uninterrupted N-terminal exons
	each encode six cadherin ectodomains while the C-terminal exons encode the cytoplasmic
	domain. These neural cadherin-like cell adhesion proteins are integral plasma membrane
	proteins that most likely play a critical role in the establishment and function of specific cell-cell
	connections in the brain. Alternative splicing has been observed and additional variants have
	been suggested but their full-length nature has yet to be determined.
