UniProt:	Q6IRL9		
Pathways:	Neurotrophin Signaling Pathway, Regulation of Lipid Metabolism by PPARalpha, Regulation of		
	Muscle Cell Differentiation, Skeletal Muscle Fiber Development		
Application Details			
Comment:	The yeast protein expression system is the most economical and efficient eukaryotic system		
	for secretion and intracellular expression. A protein expressed by the mammalian cell system is		
	of very high-quality and close to the natural protein. But the low expression level, the high cost		
	of medium and the culture conditions restrict the promotion of mammalian cell expression		
	systems. The yeast protein expression system serve as a eukaryotic system integrate the		
	advantages of the mammalian cell expression system. A protein expressed by yeast system		
	could be modificated such as glycosylation, acylation, phosphorylation and so on to ensure the		
	native protein conformation. It can be used to produce protein material with high added value		
	that is very close to the natural protein. Our proteins produced by yeast expression system has		
	been used as raw materials for downstream preparation of monoclonal antibodies.
