	receptor 19, G-protein coupled receptor 4, GPR 4, GPR19, GPR4, GPR4_HUMAN, Probable G	
	protein coupled receptor GPR4, GPCR GPR19.	
	Background: G protein-coupled receptors (GPRs or GPCRs), also known as seven	
	transmembrane receptors, heptahelical receptors, or 7TM receptors, are members of the	
	largest protein family and play a role in many different stimulus-response pathways. G-protein	
	coupled receptors mediate extracellular signals into intracellular signals (G-protein activation). They respond to a great variety of signaling molecules, including hormones, neurotransmitters	
	and other proteins and peptides. GPR proteins are integral seven-pass membrane proteins with	
	some conserved amino acid regions. GPR19, an orphan receptor, shows elevated expression	
	during embyronic development of the nervous sytem as well as in specific regions of adult	
	mouse brain, including the olfactory bulb, the hippocampus, hypothalamic nuclei and the	
	cerebellum. The GPR19 gene maps to a location on chromosome 12, which is a frequent targe	
	for rearrangement in cancer cells and involved in childhood acute lymphoblastic leukemia	
	(ALL).
