Target Details

Background:	<p>Synonyms: Dyslexia susceptibility 1 candidate 1, Dyslexia susceptibility 1 candidate gene 1 protein, DYX1, DYX1C1, DYXC1, DYXC1_HUMAN, EKN1, FLJ37882, MGC70618, RD.</p> <p>Background: The gene encoding DYX1C1 maps in the 15q21 region, which is disrupted by a translocation t(2,15)(q11,q21) and segregates with dyslexia. Two sequence changes in DYX1C1, including one involving the translation initiation sequence and an Elk-1 transcription factor binding site (-3G --> A) and a codon (1249G --> T), introduce a premature stop codon and truncate the protein by 4 amino acids. DYX1C1 encodes a nuclear tetratricopeptide repeat domain protein that is dynamically regulated in brain. In human brain, DYX1C1 protein localizes to a fraction of cortical neurons and white matter glial cells. It is also expressed in lung, kidney and testis.</p>
