	TECT3_HUMAN, Tectonic 3, Tectonic 3 precursor, Tectonic family member 3, Tectonic-3.	
	Background: Tect3 is a 607 amino acid single-pass type I membrane protein that belongs to the	
	tectonic family and exists as four alternatively spliced isoforms. Tect3 interacts with MKS1 and	
	may be involved in apoptosis regulation. The gene that encodes Tect3 contains approximately	
	31,560 bases and maps to human chromosome 10q24.1. Spanning nearly 135 million base	
	pairs and encoding nearly 1,200 genes, chromosome 10 makes up approximately 4.5 $\%$ of the	
	human genome. Several protein-coding genes, including those that encode chemokines,	
	cadherins, excision repair proteins, early growth response factors (Egrs) and fibroblast growth	
	receptors (FGFRs), are located on chromosome 10. Defects in some of the genes that map to	
	chromosome 10 are associated with Charcot-Marie Tooth disease, Jackson-Weiss syndrome,	
	Usher syndrome, nonsyndromatic deafness, Wolman?s syndrome, Cowden syndrome,	
	Cockayne syndrome, multiple endocrine neoplasia type 2 and porphyria. Tetrahydrobiopterin	
	deficiency and a number of syndromes involving defective skull and facial bone fusion are also	
	linked to chromosome 10.	
Gene ID:	26123
