	Background: DOCK 4 is a cytoplasmic peripheral membrane protein that belongs to the DOCK
	family of cytokinesis-regulating proteins. Expressed ubiquitously with highest expression in
	prostate, ovary and skeletal muscle, DOCK 4 functions as a guanine nucleotide exchange factor
	(GEF) that activates the small GTPase Rap 1 and, via this activation, plays a role in the
	regulation of adherens junctions between cells. Similar to other DOCK family members, DOCK 4
	contains an N-terminal SH3 domain, a C-terminal proline-rich region and two internal DOCK
	homology regions designated DHR1 and DHR2. Defects in the gene encoding DOCK 4 result in
	the inactivation of Rap 1 and are, thus, implicated in the pathogenesis of various cancers such
	as ovarian, prostate, glioma and colorectal carcinomas. Four isoforms of DOCK 4 are
	expressed due to alternative splicing events.
