| | Background: PTCHD2 is a 1,392 amino acid multi-pass membrane protein that contains one |
| | SSD (sterol-sensing) domain and belongs to the patched family. Expressed in retina, brain and |
| | testis, PTCHD2 localizes to endoplasmic reticulum and colocalizes with cholesterol. PTCHD2 |
| | overexpression leads to increased cholesterol levels, suggesting that PTCHD2 may play a role |
| | in cholesterol homeostasis. PTCHD2 is further hypothesized to act as a link between thyroid |
| | hormone and cholesterol metabolism. Existing as two alternatively spliced isoforms, PTCHD2 |
| | is thought to assist in the release of lipid-anchored secreted proteins and is encoded by a gene |
| | that maps to human chromosome 1p36.22. |
