Target Details	
Background:	Synonyms: Actin binding protein Schizosaccharomyces pombe sop2 like, Actin related protein
	2/3 complex subunit 1A 41 kDa, Actin-related protein 2/3 complex subunit 1A, ARC1A_HUMAN,
	Arc40, ARPC1A, SOP2-like protein, SOP2Hs, SOP2L.
	Background: This gene encodes one of seven subunits of the human Arp2/3 protein complex.
	This subunit is a member of the SOP2 family of proteins and is most similar to the protein
	encoded by gene ARPC1B. The similarity between these two proteins suggests that they both
	may function as p41 subunit of the human Arp2/3 complex that has been implicated in the
	control of actin polymerization in cells. It is possible that the p41 subunit is involved in
	assembling and maintaining the structure of the Arp2/3 complex. Multiple versions of the p41
	subunit may adapt the functions of the complex to different cell types or developmental stages.
	Alternatively spliced transcript variants encoding different isoforms have been found for this
	gene. [provided by RefSeq, Jul 2010].
Pathways:	Regulation of Actin Filament Polymerization
