	Background: ARID3B represents a member of a unique family of DNA-binding proteins that
	have roles in cell lineage gene regulation, cell cycle control, embryonic patterning and
	transcriptional regulation. ARID3B localizes to the nucleus and contains an AT-rich interactive
	domain (ARID) which has DNA-binding capabilities. Functioning as a transcription factor,
	ARID3B associates in a heterodimer with the related protein ARID3A and is believed to play an
	important role in neural crest survival during embryogenesis. In addition, ARID3B may
	participate in malignant transformation and neuroblastoma growth, suggesting a possible use
	of ARID3B as a tumor marker for neuroblastoma.
