| | Background: Chromosome 1 is the largest human chromosome spanning about 260 million | |
|---------------------|---|--|
| | base pairs and making up 8 % of the human genome. There are about 3,000 genes on | |
| | chromosome 1, and considering the great number of genes there are also a large number of | |
| | diseases associated with chromosome 1. Notably, the rare aging disease Hutchinson-Gilford | |
| | progeria is associated with the LMNA gene which encodes lamin A. When defective, the LMNA | |
| | gene product can build up in the nucleus and cause characteristic nuclear blebs. The | |
| | mechanism of rapidly enhanced aging is unclear and is a topic of continuing exploration. The | |
| | MUTYH gene is located on chromosome 1 and is partially responsible for familial adenomatous | |
| | polyposis. Stickler syndrome, Parkinsons, Gaucher disease and Usher syndrome are also | |
| | associated with chromosome 1. A breakpoint has been identified in 1q which disrupts the | |
| | DISC1 gene and is linked to schizophrenia. Aberrations in chromosome 1 are found in a variety | |
| | of cancers including head and neck cancer, malignant melanoma and multiple myeloma. The | |
| | C1orf135 gene product has been provisionally designated C1orf135 pending further | |
| | characterization. | |
