	Background: WD-repeats are motifs that are found in a variety of proteins and are characterized
	by a conserved core of 40-60 amino acids that commonly form a tertiary propeller structure.
	While proteins that contain WD-repeats participate in a wide range of cellular functions, they are
	generally involved in regulatory mechanisms concerning chromatin assembly, cell cycle control,
	signal transduction, RNA processing, apoptosis and vesicular trafficking. WDFY1 positively
	regulates TLR3- and TLR4-mediated signaling pathways by bridging the interaction between
	TLR3 or TLR4 and TICAM1. WDFY1 Promotes TLR3/4 ligand-induced activation of transcription
	factors IRF3 and NF-kappa-B, as well as the production of IFN-beta and inflammatory
	cytokines. WDFY2 acts in an adapter protein-like fashion to mediate the interaction between the
	kinase PRKCZ and its substrate VAMP2 and increases the PRKCZ-dependent phosphorylation
	of VAMP2. WDFY2 positively regulates adipocyte differentiation, by facilitating the
	phosphorylation and thus inactivation of the anti-adipogenetic transcription factor FOXO1 by
	the kinase AKT1
