	Background: FUSIP1 is a member of the Serine/Arginine (SR) family of splicing factors.
	Members of the SR family all contain one or more RNA recognition motifs (RRM) and an SR-
	rich domain. SR factors are not only essential for constitutive splicing but also regulate splicing
	in a concentration-dependent manner by influencing the selection of alternative splice sites.
	Expressed in a variety of tissues with low expression in kidney, liver and heart, FUSIP1 localizes
	to the cytoplasm and nuclear speckles. In its dephosphorylated form (occurring during M phase
	of the cell cycle), FUSIP1 functions as a potent general repressor of pre-mRNA splicing and car
	interact with U1 SnRNP 70. In its phosphorylated form, FUSIP1 interacts with Tra-2 and,
	together, they may cooperate in the regulation of splicing. Four isoforms exist for FUSIP1. In
	neurons, FUSIP1 isoforms may act to either positively or negatively regulate alternative splicing
