	Background: Antimicrobial peptides participate in the innate response, which may provide a
	barrier for protection against infection. The Dermcidin gene encodes an antimicrobial peptide
	DCD-1, which is constitutively expressed in sweat glands, secreted into the sweat, and
	transported to the epidermal surface. DCD-1 displays antimicrobial activity in response to a
	variety of pathogenic microorganisms. Overexpression of Dermcidin in breast cancers
	promotes cell growth and survival, and is coupled with a focal copy number gain of its locus on
	human chromosome 12q13.2.
