	transferase HERC2
	Background: HERC2 is a belongs to the HERC gene family that encodes a group of unusually
	large proteins, which contain multiple structural domains. All members have at least 1 copy of
	an N-terminal region showing homology to the cell cycle regulator RCC1 and a C-terminal HECT
	(homologous to E6-AP C terminus) domain found in a number of E3 ubiquitin protein ligases.
	Genetic variations in this gene are associated with skin/hair/eye pigmentation variability.
	Multiple pseudogenes of this gene are located on chromosomes 15 and 16.
Gene ID:	8924
UniProt:	095714
