	CTSR3_HUMAN, putative ion channel CatSper3.		
	Background: CatSpers (cation channel, sperm associated proteins) are ion transport proteins		
	located on the surface of sperm cells in the principal piece of the sperm tail. CatSpers are vital to sperm motility, fertilization and cAMP-mediated calcium influx in sperm. There are four		
	CatSper proteins in mammalian sperm, namely CatSper (or CatSper1), CatSper2, CatSper3 and		
	CatSper4. CatSper proteins contain a single, six-transmembrane-spanning segment and exhibit		
	the voltage-dependent Ca2+ channel four-repeat structure. CatSper proteins are believed to		
	assemble into a heterotetrameric complex, forming an alkalinization-activated Ca2+-selective		
	channel. Mutations in any of the genes encoding CatSper family proteins can result in male		
	infertility. CatSper3 plays an important role in the hyperactivated motility of sperm cells, a		
	process that is required in the preparation of sperm for fertilization.
