	protein RAB 23, Rab23, RAB23, member RAS oncogene family, RAB23_HUMAN, Ras related	
	protein Rab 23, Ras-related protein Rab-23.	
	Background: The Ras-related superfamily of guanine nucleotide binding proteins includes the R-	
	Ras, Rap, Ral/Rec and Rho/Rab subfamilies. Increasing data suggests an important role for	
	Rab proteins in either endocytosis or in biosynthetic protein transport. The process of	
	transporting newly synthesized proteins from the endoplasmic reticulum to various stacks of	
	the Golgi complex and to secretory vesicles involves the movement of carrier vesicles and	
	requires Rab protein function. Rab proteins are also an integral part of endocytic pathways. Rab	
	23, also known as HSPC137, is a 237 amino acid member of the Rab family of proteins and	
	localizes to the cytoplasmic side of the cell membrane. Rab 23 is believed to play a role in	
	intracellular protein transportation and signal transduction mediated by small GTPases.	
	Mutations in the gene encoding Rab 23 may result in Carpenter syndrome, also known as	
	ACPS2 (acrocephalopolysyndactyly type 2), a condition characterized by obesity, cardiac	
	defects, polysyndactyly and craniosynostosis.
