	formation of phosphatidylethanolamine from phosphatidylserine via phosphatidylserine
	decarboxylation. Type I PSDs contain LGST motifs and are found in bacteria and eukaryotic
	mitochondria, whereas type II PSDs contain GGST motifs and are found in eukaryotic
	endomembrane systems. PISD (phosphatidylserine decarboxylase), also known as
	phosphatidylserine decarboxylase proenzyme, PSDC, PSD, PSSC, DJ858B16, dJ858B16.2 or
	DKFZp566G2246, is a 408 amino acid a type I phosphatidylserine decarboxylase that localizes
	to the inner mitochondrial membrane. PISD contains a conserved LGST motif which is cleaved
	to produce two isoforms known as PISD and PISD $\_$ . PISD is capable of forming a heterodimer
	and is highly expressed in liver and testis. The gene encoding PISD maps to human
	chromosome 22q12.2.
