Background:	Synonyms: MEG10_HUMAN, MEGF protein, megf10, Multiple EGF-like domains protein 10,	
	multiple EGF-like-domains 10, Multiple epidermal growth factor-like domains 10, Multiple	
	epidermal growth factor-like domains protein 10.	
	Background: MEGF10 is a 1,140 amino acid protein encoded by the human gene MEGF10.	
	MEGF10 belongs to the MEGF family and contains fifteen EGF-like domains and one EMI	
	domain. The engulfment of dying cells is a specialized form of phagocytosis that is highly	
	conserved across evolution and is mediated by the concerted action of several molecules.	
	MEGF10 is an engulfment receptor protein that localizes to the plasma membrane in a	
	punctuated pattern. The MEGF10 protein shares structural similarities with nematode	
	engulfment receptor cell death abnormal-1 (CED-1). MEGF10 function is modulated by the ATP	
	binding cassette transporter ABCA1, which is an ortholog to CED-7. It is expressed at the cell	
	surface in clusters around cell corpses during engulfment, and during the engulfment of	
	apoptotic thymocytes is recruited to the bottom of the forming phagocytic cup.	
Gene ID:	84466	
Pathways:	Regulation of Muscle Cell Differentiation
