	Background: Armadillo Repeat gene deleted in Velo-Cardio-Facial syndrome (ARVCF) is a
	member of the catenin family. This family plays an important role in the formation of adherens
	junction complexes, which are thought to facilitate communication between the inside and
	outside environments of a cell. The ARVCF gene was isolated in the search for the genetic
	defect responsible for the autosomal dominant Velo-Cardio-Facial syndrome (VCFS), a
	relatively common human disorder with phenotypic features including cleft palate, conotruncal
	heart defects and facial dysmorphology. The ARVCF gene encodes a protein containing two
	motifs, a coiled coil domain in the N-terminus and a 10 armadillo repeat sequence in the
	midregion. Since these sequences can facilitate protein-protein interactions ARVCF is thought
	to function in a protein complex. In addition, ARVCF contains a predicted nuclear-targeting
	sequence suggesting that it may have a function as a nuclear protein. [provided by RefSeq, Jun
	2010].
