Background:	Synonyms: Ab2 162, C6orf32, DF48, FA65B_HUMAN, Fam65b, KIAA0386, PL48, Protein FAM65B.	
	Background: Making up nearly 6 % of the human genome, chromosome 6 contains around	
	1,200 genes within 170 million base pairs of sequence. Deletion of a portion of the q arm of	
	chromosome 6 is associated with early onset intestinal cancer suggesting the presence of a	
	cancer susceptibility locus. Porphyria cutanea tarda is associated with chromosome 6 through	
	the HFE gene which, when mutated, predisposes an individual to developing this porphyria.	
	Notably, the PARK2 gene, which is associated with Parkinson's disease, and the genes	
	encoding the major histocompatiblity complex proteins, which are key molecular components	
	of the immune system and determine predisposition to rheumatic diseases, are also located on	
	chromosome 6. Stickler syndrome, 21-hydroxylase deficiency and maple syrup urine disease	
	are also associated with genes on chromosome 6. A bipolar disorder susceptibility locus has	
	been identified on the q arm of chromosome 6. The C6orf32 gene product has been	
	provisionally designated C6orf32 pending further characterization.	
Gene ID:	9750	
Pathways:	Transition Metal Ion Homeostasis
