Target Details

Background:	Synonyms: CPL, HEPH, HEPH_HUMAN, Hephaestin.
	Background: Hephaestin is a single-pass type I membrane protein that belongs to the
	multicopper oxidase family of proteins. Hephaestin, a copper-dependant ferroxidase protein, is
	crucial for iron exiting intestinal enterocytes into the circulation. It mediates the movement of
	iron across the basolateral membrane in conjunction with ferroportin 1. This is an important
	link between iron and copper metabolism in mammalian systems, as copper deficiency leads to
	reduced hephaestin and reduced iron absorption resulting in anemia. Hephaestin can bind six
	copper ions per monomer and is regulated by the homeobox transcription factor CDX2.
	Increased levels of iron leads to an increase in CDX2 expression and thus Hephaestin.
	Hephaestin is primarily detected in the intestine, but is also expressed in colon, breast, bone
	trabecural cells and fibroblasts.
Gene ID:	9843
Pathways:	Transition Metal Ion Homeostasis
