	Background: The cystatin superfamily is a well-established family of cysteine protease
	inhibitors. All true cystatins inhibit cysteine peptidases of the papain family, such as cathepsins
	while some also inhibit legumain family enzymes. The CRES (cystatin-related epididymal
	spermatogenic) protein defines a new subgroup in the family 2 cystatins of the cystatin
	superfamily. CRES proteins lack two of the three consensus sites necessary for the cystatin
	inhibition of C1 cysteine proteases. They are also preferentially expressed in postmeiotic germ
	cells, the proximal caput epididymidis, and anterior pituitary gonadotrophs. Therefore, CRES
	proteins may perform unique and tissue-specific functions in the reproductive and
	neuroendocrine systems. As a member of the CRES subfamily, Cystatin-like 1 (CSTL1) is a 145
	amino acid protein and is expressed in testis.
