	containing 5, ZBED5_HUMAN.
	Background: ZBED5 contains 1 BED type zinc finger and it may be derived from an ancient
	transposon that has lost its ability to translocate. This gene is unusual in that its coding
	sequence is mostly derived from Charlie like DNA transposon. There is mRNA and EST
	evidence to suggest that this gene is transcribed. The encoded protein shares 70 % identity with
	Charlie 1 transposase, however, this gene does not appear to be an active DNA transposon as it
	is not flanked by terminal inverted repeats. The exact function of this gene product is not
	known.
