Target Details

Background:	Synonyms: Chitobiase di N acetyl, CTB, Di N acetylchitobiase, OTTHUMP00000011570,
	DIAC_HUMAN. Packground: CTDS is an evalutionarily concerned member of the glycopyl bydrologe 19 family.
	Background: CTBS is an evolutionarily conserved member of the glycosyl hydrolase 18 family
	of proteins. Localizing to the lysosome, CTBS plays a role in the degradation of asparagine-
	linked (Asn-linked) glycoproteins. Glycoproteins are translocated to lysosomes via endocytosis or autophagy where they are broken down by proteases and glycosidases. The catabolism of
	glycoproteins is an important step in the regular turnover of cellular contents and in maintaining
	the homeostasis of glycosylation. CTBS functions as a glycosidase that cleaves the reducing
	end GlcNAc from the core chitobiase unit of oligosaccharides. Before this reaction can occur,
	AGA (the lysosomal glycosylasparaginase) must first remove the Asn from the Asn-linked
	glycoprotein to expose the reducing end GlcNAc, thereby allowing CTBS to access the exposed
	moiety.
