	Unique cartilage matrix-associated protein C-terminal fragment, Upper zone of growth plate
	and cartilage matrix associated.
	Background: UCMA is a 138 amino acid secreted protein that is highly expressed in resting
	chrondrocytes in developing long bones and is thought to function in the early phase of
	chrondrocyte differentiation. A furin-like protease processes UCMA into an N-terminal 37 amino
	acid peptide and a C-terminal 74 amino acid peptide, which is referred to as Unique cartilage
	matrix-associated protein C-terminal fragment (Ucma-C). Introduction of recombinant Ucma-C
	interferes with osteogenic differentiation of mesenchymal stem cells, MC3T3-E1
	preosteoblasts and primary osteoblasts. This suggests that Ucma may be involved in the
	negative regulation of osteogenic differentiation of osteochondrogenic precursor cells at the
	cartilage-bone interface and in peripheral zones of fetal cartilage.
