| | Background: The ABLIM1 protein has an N-terminal domain that contains four double zinc |
| | finger motifs, which conform to the LIM motif consensus sequence. ABLIM1 binds to F-Actin |
| | through a dematin-like domain and is expressed in retina, brain and muscle tissue. There are |
| | four known isoforms of ABLIM1. The gene encoding ABLIM1 maps to a region of chromosome |
| | 10 associated with frequent loss of heterozygosity in human tumors, thus identifying ABLIM1 |
| | as a candidate tumor suppressor gene. ABLIM2 and ABLIM3 show highest expression in |
| | muscle and neuronal tissues, bind to F-Actin, and are localized on stress fibers. They also have |
| | been shown to enhance STARS (striated muscle activator of Rho signaling) dependent |
| | activation of serum-response factor (SRF), thereby modulating transcription. |
