	Background: This gene encodes a member of the filamin family. The encoded protein interacts	
	with glycoprotein Ib alpha as part of the process to repair vascular injuries. The platelet	
	glycoprotein Ib complex includes glycoprotein Ib alpha, and it binds the actin cytoskeleton.	
	Mutations in this gene have been found in several conditions: atelosteogenesis type 1 and type	
	3, boomerang dysplasia, autosomal dominant Larsen syndrome, and spondylocarpotarsal	
	synostosis syndrome. Multiple alternatively spliced transcript variants that encode different	
	protein isoforms have been described for this gene. [provided by RefSeq, Nov 2009].
