Target Details

Background:	Synonyms: FMN, Formin 1, Formin1, Formin-1, LD, Limb deformity protein homolog,		
	FMN1_HUMAN.		
	Background: The temporal genetic hierarchy influencing normal limb development can		
	deregulate and mediate mammalian developmental syndromes. In mice, the limb deformity (Id)		
	locus influences normal limb development and gives rise to alternative mRNAs that can		
	translate into a family of proteins known as formins. Formins play a crucial role in cytoskeletal		
	reorganization by influencing Actin filament assembly. Formins co-localize with the actin		
	cytoskeleton and can translocate into the cell cytosol and into the nucleus in an HGF-dependent		
	manner. Vertebrate nuclear formins can control polarizing activity in limb buds through		
	establishment of a Sonic hedgehog/FGF-4 feedback loop. Deficiency mutations at the		
	mammalian ld locus lead to profound developmental defects in limb and kidney formation. The		
	human Formin 1 and 2 genes map to chromosome 15q13.3 and 1q43, respectively.
