|                     | protein FRAT2, FRAT2_HUMAN.   |
|                     | Background: FRAT1 and FRAT2 were originally characterized as proteins frequently rearranged     |
|                     | in advanced T cell lymphoma, and they have since been identified as proto-oncogenes involved    |
|                     | in tumorigenesis. These proteins share significant homology with the Xenopus glycogen           |
|                     | synthase kinase-3 (xGSK-3) binding protein, which is designated GBP and is essential for the    |
|                     | formation of the dorsal-ventral axis during embryonic development. Establishment of these       |
|                     | embryonic axes is mediated by the Wnt intracellular signaling pathway. Wnt signaling is         |
|                     | regulated in part by the activity of GSK-3, which phosphorylates and thereby facilitates the    |
|                     | degradation of ?catenin. GBP binds to GSK-3 and inhibits this phosphorylation, resulting in the |
|                     | accumulation of ?catenin and the subsequent transcription of Wnt target genes. Like GBP,        |
|                     | FRAT2 has been shown to bind xGSK-3, suggesting that FRAT1 and FRAT2 may be GSK-3               |
|                     | regulatory proteins.  |
