	<ul> <li>finger and BTB domain containing 4, Zinc finger and BTB domain-containing protein 4, ZNF903.</li> <li>Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of</li> <li>functions, most of which encompass some form of transcriptional activation or repression. The</li> <li>majority of zinc-finger proteins contain a Kr_ppel-type DNA binding domain and a KRAB</li> <li>domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins.</li> <li>ZBTB4 (zinc finger and BTB domain containing 4), also known as KAISO-L1 (KAISO-like zinc</li> <li>finger protein 1), is a 1,013 amino acid nuclear protein that is involved in transcriptional</li> <li>regulation. ZBTB4 contains one BTB (POZ) domain, six C2H2-type zinc fingers and is</li> <li>phosphorylated and downregulated by HIPK2. The gene encoding ZBTB4 maps to human</li> <li>chromosome 17, which comprises over 2.5 % of the human genome and encodes over 1,200</li> <li>genes.</li> </ul>
