Background:	Synonyms: FAST 1, Fast 2, Fast-1, Fast-2, FAST1, Fast2, Forkhead activin signal transducer 1,
	Forkhead activin signal transducer 2, Forkhead box H1, Forkhead box protein H1, FOX H1,
	FOXH 1, FOXH1, FOXH1_HUMAN, hFAST 1, hFAST-1, hFAST1, Human homolog of Xenopus
	forkhead activin signal transducer 1, TGF beta/Activin signal transducer FAST1.
	Background: Xenopus winged-helix factor, xFAST-1 (forkhead activin signal transducer-1) is a
	transcription factor that forms a complex with the receptor-regulated Smad protein, Smad2,
	and directly binds to activin response elements on DNA (1,2). The human homolog FAST-1 and
	the corresponding mouse homolog, designated FAST-2, share significant sequence homology
	with xFAST-1, including a conserved N-terminal forkhead domain that consists of 110 amino
	acid residues and is essential for binding DNA and regulating transcription in embryogenesis, in
	tumorigenesis and in the maintenance of differentiated cell states (3,4). FAST-1 and FAST-2
	also contain a distinct C-terminal Smad interaction domain that is required for the association
	with various Smad proteins, including Smad2, Smad3 and Smad4 (3,5). Expression of FAST-1
	and FAST-2 is predominantly observed during early development, with lower levels detected in
	adult tissues (6,7). FAST-1 and FAST-2 mediated DNA binding is attenuated by both TFGB, and
	activin, indicating that these FAST proteins mediate TFGB, induced signal transduction (3).
