	hGHV, Placenta specic growth hormone, Placental specic growth hormone, SOM2_HUMAN.
	Background: Growth hormone 2 (GH2) is a member of the somatotropin/prolactin family of
	hormones which play an important role in growth control. The gene, along with four other
	related genes, is located at the growth hormone locus on chromosome 17 where they are
	interspersed in the same transcriptional orientation, an arrangement which is thought to have
	evolved by a series of gene duplications. The five genes share a remarkably high degree of
	sequence identity. Mutations in this gene lead to placental growth hormone/lactogen
	deficiency. The major role of GH2 in stimulating body growth is to stimulate the liver and other
	tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It
	also stimulates amino acid uptake and protein synthesis in muscle and other tissues.
Gene ID:	2689
Pathways:	NF-kappaB Signaling, JAK-STAT Signaling, Response to Growth Hormone Stimulus
