	CTSR3_HUMAN, putative ion channel CatSper3.	
	Background: CatSpers (cation channel, sperm associated proteins) are ion transport proteins	
	located on the surface of sperm cells in the principal piece of the sperm tail. CatSpers are vital to sperm motility, fertilization and cAMP-mediated calcium influx in sperm. There are four	
	CatSper proteins in mammalian sperm, namely CatSper (or CatSper1), CatSper2, CatSper3 and	
	CatSper4. CatSper proteins contain a single, six-transmembrane-spanning segment and exhibi	
	the voltage-dependent Ca2+ channel four-repeat structure. CatSper proteins are believed to	
	assemble into a heterotetrameric complex, forming an alkalinization-activated Ca2+-selective	
	channel. Mutations in any of the genes encoding CatSper family proteins can result in male	
	infertility. CatSper3 plays an important role in the hyperactivated motility of sperm cells, a	
	process that is required in the preparation of sperm for fertilization.
