	CEP57_HUMAN, FGF2 interacting protein, FGF2-interacting protein, KIAA0092, MVA2, PIG8,
	proliferation inducing protein 8, Testis specic protein 57, Testis-specic protein 57, Translokin,
	TSP57.
	Background: CEP57 (centrosomal protein 57 kDa), also known as PIG8, TSP57 or Translokin, is
	a 500 amino acid protein that localizes to both the nucleus and the cytoplasm, specifically
	associating with microtubules at the centrosome. Expressed ubiquitously, CEP57 exists as a
	homodimer that functions to mediate the mitogenic activity and nuclear translocation of FGF-2,
	an internalized growth factor, thereby regulating FGF-2 signaling pathways. Additionally, CEP57
	is thought to play a role in spermatogenesis, possibly via the indirect regulation of gene
	expression. Human CEP57 shares 88 % sequence identity with its mouse and bovine orthologs,
	suggesting a highly conserved role between species. Multiple isoforms of CEP57 exist due to
	alternative splicing events.
Pathways:	M Phase, Maintenance of Protein Location, Protein targeting to Nucleus, Growth Factor Binding
