#### Target Details

| GI/GS/GO gamma-7 subunit, Guanine nucleotide-binding protein GI/GS/GO subunit gamma-7.              |  |  |
|---|--|--|
| Background: Guanine nucleotide-binding proteins (G proteins) are involved as a modulator or         |  |  |
| transducer in various transmembrane signaling systems. The beta and gamma chains are                |  |  |
| required for the GTPase activity, for replacement of GDP by GTP, and for G protein-effector         |  |  |
| interaction. Plays a role in the regulation of adenylyl cyclase signaling in certain regions of the |  |  |
| brain. Plays a role in the formation or stabilzation of a G protein heterotrimer (G(olf) subunit    |  |  |
| alpha-beta-gamma-7) that is required for adenylyl cyclase activity in the striatum.                 |  |  |
