|                     | Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of        |  |
|                     | functions, most of which encompass some form of transcriptional activation or repression. The  |  |
|                     | majority of zinc-finger proteins contain a Kr_ppel-type DNA binding domain and a KRAB          |  |
|                     | domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. |  |
|                     | Zinc finger and BTB domain-containing protein 5 (ZBTB5) is a 677 amino acid member of the      |  |
|                     | Kr_ppel C2H2-type zinc-finger protein family. Localized to the nucleus, ZBTB5 contains a BTB   |  |
|                     | domain, also known as a POZ domain, which inhibits DNA binding and mediates homotypic and      |  |
|                     | heterotypic dimerization. Characteristics of the BTB domain suggest that ZBTB5 functions as a  |  |
|                     | transcription regulator.   |  |
