| associated protein 1, CAMP1_HUMAN, camsap1, PRO2405. |
|---|
| Background: CAMSAP1L1 is a 1,489 amino acid protein that contains one calponin-homology |
| domain and one CKK domain, which serves to bind microtubules. There are three isoforms of |
| CAMSAP1L1 that are produced as a result of alternative splicing events. The gene encoding |
| CAMSAP1L1 maps to human chromosome 1, the largest human chromosome spanning about |
| 260 million base pairs and making up 8 % of the human genome. There are about 3,000 genes |
| on chromosome 1, and considering the great number of genes there are also a large number of |
| diseases associated with chromosome 1. Notably, the rare aging disease Hutchinson-Gilford |
| progeria is associated with the LMNA gene which encodes lamin A. The MUTYH gene is |
| located on chromosome 1 and is partially responsible for familial adenomatous polyposis. |
| Stickler syndrome, Parkinsons, Gaucher disease and Usher syndrome are also associated with |
| chromosome 1. |
