	Background: Microtubules mediate the spatial organization of diverse membrane-trafficking		
	systems. The HOOK proteins, HOOK1, HOOK2 and HOOK3, comprise a family of cytosolic		
	coiled-coil proteins that contain conserved N-terminal domains, which attach to microtubules,		
	and more divergent C-terminal domains, which mediate binding to organelles. HOOK1, a		
	cytoskeletal linker protein, may play a role in endocytic membrane trafficking. It exists as a		
	homodimer, most likely mediated through its central coiled-coil domain. HOOK1 interacts with		
	VPS18 and is required for spermatid differentiation, in which it is most likely involved in the		
	positioning of the manchette microtubules and the flagellum. HOOK1 localizes primarily to the		
	cytoplasm and does not associate with the Golgi complex, unlike HOOK3, which participates in		
	the organization of the cis-Golgi compartment.
