	associated protein A1 acidic component 1, Pro-TGF-alpha cytoplasmic domain-interacting		
	protein 1, TACIP1, Syntrophin-1.		
	Background: Syntrophins are cytoplasmic peripheral membrane scaffold proteins that are		
	components of the dystrophin-associated protein complex. This gene is a member of the		
	syntrophin gene family and encodes the most common syntrophin isoform found in cardiac		
	tissues. The N-terminal PDZ domain of this syntrophin protein interacts with the C-terminus of		
	the pore-forming alpha subunit (SCN5A) of the cardiac sodium channel Nav1.5. This protein		
	also associates cardiac sodium channels with the nitric oxide synthase-PMCA4b (plasma		
	membrane Ca-ATPase subtype 4b) complex in cardiomyocytes. This gene is a susceptibility		
	locus for Long-QT syndrome (LQT) - an inherited disorder associated with sudden cardiac death		
	from arrhythmia - and sudden infant death syndrome (SIDS). This protein also associates with		
	dystrophin and dystrophin-related proteins at the neuromuscular junction and alters		
	intracellular calcium ion levels in muscle tissue. [provided by RefSeq, Jan 2013].
